this book is a comprehensive illustrated surgical guide to operative exposures of the spinal nerves also known as peripheral nerves each chapter is devoted to a particular nerve and describes the origin anatomic relations branches surgical approaches and clinical significance the text is concise and easy to read and is complemented by informative color photos from cadaveric dissections and surgical procedures a separate chapter on technical notes identifies surgical pearls relating to techniques such as nerve suturing and nerve transfers importantly unlike other peripheral nerve atlases this book is accompanied by videos of different approaches the book will be especially valuable for residents and fellows in training and candidates for oral board and moc examinations it is also designed to provide a quick illustrated review for surgeons unfamiliar with a procedure most videos are less than 5 minutes long and it should take less than 10 minutes to review each approach including watching the video anatomy and exposures of spinal nerves will effectively fill a gap caused by the absence of a peripheral nerve surgeon from many neurosurgery training programs

the nervous system is particularly fascinating for many biologists because it controls animal characteristics such as movement behavior and coordinated thinking invertebrate neurobiology has traditionally been studied in specific model organisms whilst knowledge of the broad diversity of nervous system architecture and its evolution among metazoan animals has received less attention this is the first major reference work in the field for 50 years bringing together many leading evolutionary neurobiologists to review the most recent research on the structure of invertebrate nervous systems and provide a comprehensive and authoritative overview for a new generation of researchers presented in full colour throughout structure and evolution of invertebrate nervous systems synthesizes and illustrates the numerous new findings that have been made possible with light and electron microscopy these include the recent introduction of new molecular and optical techniques such as immunohistochemical staining of neuron specific antigens and fluorescence in situ hybridization combined with visualization by confocal laser scanning microscopy new approaches to analysing the structure of the nervous system are also included such as micro computational tomography cryo soft x ray tomography and various 3 d visualization techniques the book follows a systematic and phylogenetic structure covering a broad range of taxa interspersed with chapters focusing on selected topics in nervous system functioning which are presented as research highlights and perspectives this comprehensive reference work will be an essential companion for graduate students and researchers alike in the fields of metazoan neurobiology morphology zoology phylogeny and evolution
